Implementation Roadmap – SEL Collaboration Edition

A Developmentally Aligned Framework for Ethical AI Literacy

Richard Silverman

April 2026

Prepared for educational review and collaborative exploration

Overview

This roadmap outlines a practical and low-burden pathway for exploring how ethical AI literacy may complement existing Social and Emotional Learning (SEL), digital citizenship, and technology initiatives.

The approach emphasizes thoughtful exploration rather than rapid adoption. Schools and organizations may begin with small pilot efforts, learn from implementation, and expand only where natural alignment exists.

This document provides a high-level implementation pathway. Detailed competencies and instructional examples are provided in the accompanying framework document.

This model is intended to complement existing SEL and digital citizenship efforts rather than introduce new standalone requirements.

Phase 1 — Exploration and Pilot Preparation

A small number of interested schools, districts, or partner organizations review the framework to determine potential alignment with existing priorities.

Activities in this phase may include:

- Review of framework and overview materials
- Identification of existing instructional spaces where concepts may naturally fit
- Informal educator discussions or brief virtual orientation sessions
- Identification of simple indicators of success such as student engagement or discussion quality

The goal of this phase is alignment and feasibility review rather than commitment to implementation.

Phase 2 — Small Scale Pilot Implementation

Selected educators explore small, developmentally appropriate activities drawn from the framework.

Examples may include:

- Early elementary communication awareness activities
- Middle school prompt literacy exploration
- High school evaluation and verification exercises
- Integration into existing digital citizenship or advisory periods

Educators may document observations related to student engagement, discussion quality, and ease of integration into existing instruction.

Phase 3 — Reflection and Refinement

After an initial exploration period, participating educators or organizations reflect on outcomes and identify adjustments.

Reflection may include:

- Educator observations
- Student engagement patterns
- Alignment with SEL or digital citizenship goals
- Practical implementation considerations

Insights from this phase help refine materials and identify practices that are most practical for real classrooms.

Phase 4 — Optional Expansion

If early exploration shows value, expansion may occur gradually and voluntarily.

Possible directions may include:

- Development of optional educator guidance materials
- Sharing practices among interested schools or districts
- Collaboration with SEL or digital citizenship initiatives
- Exploration of connections to workforce readiness or responsible technology use discussions

Expansion is intended to remain flexible so organizations can adapt use based on their own context and priorities.

Guiding Principles

The roadmap is guided by several practical principles:

- Start small and learn from practice
- Integrate rather than add instructional burden
- Emphasize educator flexibility
- Focus on student awareness rather than technical specialization
- Expand only where value is demonstrated

The goal is not rapid scale, but thoughtful integration that supports responsible habits of communication, inquiry, and judgment when students interact with AI-supported tools.

Communication and Collaboration

Because this work is being developed independently, communication is most effective through written correspondence. Due to a health condition that limits meeting availability, collaboration is typically conducted asynchronously through email. This allows thoughtful responses and careful refinement of materials.

Questions, feedback, or requests for clarification are very welcome through written communication.
